"We used 1000kg of granite within the project - that's 2 African elephants!"

JD Wetherspoon

JD Wetherspoon awarded the project to Celestra to provide data & power cabling and shop fitting services to facilitate the installation of a new Zonal EPoS system.

This was a large scale installation covering more than 700 sites across the UK and with the long hours operated by JD Wetherspoon, meant that all of the works had to be planned and executed overnight. The key challenge for field teams was to get every site operational in preparation for breakfast.

Celestra ensured that the data & power cabling at every site met the new standard required by the customer. This led to a mixed model where on certain sites we were able to adapt the existing infrastructure and others required a complete new data & power cable installation.

To accommodate the new Zonal Tills we were required to make modifications to the existing bars which were predominately granite. We developed a robust process which allowed us to identify the correct type of granite in advance. This was cut and matched to purpose fit each site allowing our skilled team of shop fitters to fit the final solution.

Our meticulous planning was vital in delivering a smooth, trouble-free installation, which was achieved by conducting site surveys, by committing dedicated cabling teams to the project and with our shop fitting teams working in unison with our granite stonemason's.

The project was successfully delivered with effective, efficient and consistent communication between JD Wetherspoon and Celestra coupled with our thorough project management and highly skilled cable teams and shop fitters. We were pleased to be able to deliver this project on time and to a high standard.
